

thefirebeam™
protection system

accessory range

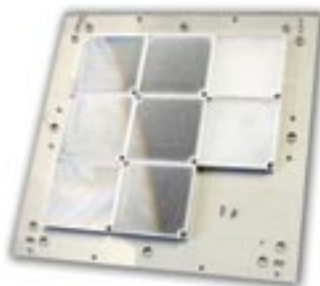

We have developed this accessory range so that you can extend the range of the **firebeam** all the way up to 100m. Using these range kits allows the **firebeam** head to automatically adjust its power to the lowest possible setting. This means a narrow beam and far less problems of spurious reflections that can effect other beams – the range kits and adapter plate are especially designed to make the technicians life easier, no more finding and making up backing plates – which means less time installing leading to cost savings.

Mid Range Kit

The standard **firebeam** covers distances of up to 40 metres, but with the addition of our Mid Range Kit it can also cover distances between 40 and 80 metres.

The **firebeam** Mid Range Kit is a clear acrylic plate with 3 extra reflectors attached. Simply add the Single Reflector that is provided with the standard **firebeam** into the spare space on the plate using the screws provided. For your convenience, the plate is pre-drilled to suit the universally popular Unistrut system.

Long Range Kit

The standard **firebeam** covers distances of up to 40 metres, but with the addition of our Long Range Kit it can also cover distances between 80 and 100 metres.

The **firebeam** Long Range Kit is a clear acrylic plate with 8 extra reflectors attached. Simply add the Single Reflector that is provided with the standard **firebeam** into the spare space on the plate using the screws provided. For your convenience, the plate is pre-drilled to suit the universally popular Unistrut system.

Adaptor Plate

The Adaptor Plate is a clear acrylic plate that allows easy mounting of the **firebeam** Head Unit to Unistrut fabrication. The holes are pre-drilled to the correct pitch of the Head Unit and are conveniently positioned for use with the popular Unistrut system using the screws provided.
